

ABSTRACT OF THE DISCLOSURE

- 5 A computer to telephone interface card comprises a plurality of audio data input ports, a mixer, and a converter. The mixer receives audio input data from audio data input ports and, in real-time, generates a mixed audio output data signal at the mixer output. The converter has an output connecting to a phone line to generate and provide mixed audio output to the phone line based on the audio input data received at the plurality of audio data input ports.
